

FS001: Personnel Profile Page Component

Project Stream: User Experience & Interface

Priority: High

Target Audience: Engineering Interns

Date: June 2026

Project Background

Now that we have successfully built a pipeline to ingest and profile our legacy personnel data, the next phase is rendering this information for our internal operations dashboard [cite: 4].

You are required to build a responsive, modern **Personnel Profile Page** component [cite: 4]. This UI will eventually bind to our Graph API, but for this sprint, you will build the interface layout and seed it using the structured personnel data parsed from the previous legacy archive assignment (**ENG-AI001**) [cite: 4].

Core Engineering Directive: Responsible AI Usage

Strict Policy Regarding Generative AI Tools

- **No Copy-Pasting UI Framework Blocks:** Do not use AI to generate entire HTML structures or massive CSS layout blocks [cite: 4].
- **Use AI to Learn Layout Mechanics:** Use AI exclusively as a conceptual mentor [cite: 4]. Use it to understand modern layout principles (e.g., *"Explain the difference between CSS Grid and Flexbox for profile card layouts"* or *"How do I implement accessible ARIA labels for data fields?"*), then construct the layout by hand [cite: 4].
- **The Goal:** True UI competence comes from mastering document structure and responsive design layout properties, not from prompt-engineering a pre-made template [cite: 4].

Functional Objectives

You must build a clean web interface layout (**profile.html** and **style.css**) that satisfies the following component requirements [cite: 4]:

1. **Header & Identification Block:** Display the individual's core identifiers prominently: Full Name, Unique ID (**INT-XXX**), and assigned Guild Badge [cite: 4].
2. **Metrics Dashboard Grid:** Create a visual grid displaying key numeric data metrics: Cumulative XP Earned and Total Completed Tasks [cite: 4].

3. **Timeline & Status Track:** Display the Employee's Join Date and current Performance Rating using appropriate visual indicators (e.g., color-coded labels based on performance tiers) [cite: 4].
4. **Data Integrity Indicator:** Include a small metadata footer showing a timestamp of when the profile record was last synced/validated against the ingestion pipeline [cite: 4].

Success & Acceptance Criteria

Your UI component will be reviewed under local server rendering and must pass these specific criteria [cite: 4]:

- ☐ **Semantic HTML Structure:** The markup must use correct semantic tags (`<header>`, `<main>`, `<section>`, `<footer>`) rather than generic nested `<div>` chains [cite: 4].
- ☐ **Responsive Fluidity:** The page layout must shift cleanly from desktop monitor view down to mobile viewports without horizontal scrolling or text overlap [cite: 4].
- ☐ **CSS Separation:** All presentation styles must reside exclusively within `style.css`. No inline styling (`style="..."`) is permitted in `profile.html` [cite: 4].
- ☐ **Data Match Accuracy:** The initial rendered state must exactly display the hardcoded values from your mock starter profile script without rendering errors [cite: 4].

Technical Submission Checklist

Ensure your repository branch contains the following artifacts before submitting a Pull Request [cite: 4]:

- ☐ `profile.html` (*Semantic structure layout*) [cite: 4]
- ☐ `style.css` (*Responsive design styling*) [cite: 4]
- ☐ `README.md` (*With your environment setup details filled out*) [cite: 4]
- ☐ `ui_capture.png` (*A desktop and mobile viewport screenshot verifying design fluidity*) [cite: 4]
